BOROUGH OF ELMWOOD PARK  
PLANNING BOARD

WEDNESDAY, OCTOBER 11, 2023  
TAKEN PLACE: Municipal Building  
Elmwood Park, New Jersey  
Commencing at 7:30 PM

BEFORE: The Planning Board of  
Elmwood Park

JEFFREY FREITAG, CHAIRMAN  
MAYOR ROBERT COLLETTI, Member  
COUNCILMAN FASOLO, Member  
JOSEPH BENIAMINI, Member  
ANTONIO CASTELBUONO, Member  
ROMANO INTRIERI, Member  
JOSEPH MULLIGAN, Absent  
MYLES GARVEY, Member  
CARL ROBERTS, Absent  
ROBERT ELDER, Member  
ANDREW TISELLANO, Member  
ERIC SAIMSON, Member

ALSO PRESENT:  
JOHN A. CONTE, JR., ESQ.,  
ATTORNEY TO THE BOARD  
JOHN CHAYKO, BOARD ENGINEER  
SUBURBAN ENGINEERING  
JOSPEH A. POMANTE, ENGINEER  
BOSWELL ENGINEERING (TRAFFIC)  
CARRIE PARETTI, SECRETARY

MINUTES PREPARED BY:  
BETH CALDERONE

OCTOBER 11, 2023

ELMWOOD PARK PLANNING BOARD  
REGULAR MEETING

Chairman Freitag called the Regular meeting of the Elmwood Park Planning Board to order, according to the Open Public Meeting Act, OCTOBER 11, 2023 @7:30 PM

\*\*\*\*\*  
FLAG SALUTE  
\*\*\*\*\*

MINUTES: SEPTEMBER 13, 2023 - Motion offered by Member Elder, second by Member Garvey to approve the minutes as submitted.

Members voted Unanimously to accept the minutes as submitted.

-----  
P23-003  
GARDEN CANNABIS DISPENSARY, LLC  
265 Route 46  
Block 1705, Lot 2  
Site Plan approval for retail store  
Licensed Class 5 Cannabis Retail

Applicant is amending their application to request both preliminary and final site plan approval this evening.

The application was filed with the New Jersey Cannabis Regulatory Commission in June of 2022 and is still pending. Applicant applied first with the Borough of Elmwood Park for their Cannabis license back in March of 2022 and received a Resolution of Support from the Borough Council April 21st of 2022.

Traffic is a concern for the board and the applicant heard their concerns from the work session meeting regarding traffic and number of cars coming in and out of the site and traffic flow issues.

Applicant came up with a solution, keeping the existing footprint of the building, however, reducing the gross floor area of the cannabis business by half.

1  
2 The prior existing use was an auto  
3 mall with showroom and office. Applicant is keeping  
4 the bifurcated structure of the building in place.  
5 There will be a proposed covered car port to allow  
6 full circulation around the building and having one  
7 way traffic around the building for efficient  
8 circulation.

9 The parking requirement is one space  
10 for every 200 square feet of gross floor area.  
11 Gross floor area is 2,915. Fifteen parking spaces  
12 are required, where as 23 spaces are proposed,  
13 including one ADA space.

14 Deliveries will be two to five times  
15 a week with advance notification.

16 Seeking a conditional permitted use  
17 in the zone, applicant meets all of the conditional  
18 use requirements. The property is surrounded by  
19 commercial properties and is not located within 500  
20 feet of a school.

21 Minor site improvements will make  
22 the site safer and maximize the number of parking  
23 spaces within the site's constraints.

24 Applicant is proposing to change the  
25 current two-way circulation around the building to  
be one-way circulation to and from Mola Boulevard.

26 The proposed access aisle around the  
27 building is 24 feet. The only areas less than 24  
28 feet will be in the car port area adding a  
29 landscaped strip, curb, and bollards for protection  
30 of pedestrians. Refuse will be handled by a  
31 private hauler in the off hours with no  
32 interference with any normal vehicular traffic on  
33 site.

34 Deliveries to the site will be small  
35 vans, sprinter-type vans. Architectural drawings  
36 were submitted showing the applicant's intention to  
37 modify the existing auto mall and auto service into  
38 a highly functional and secured dispensary. Front  
39 of store for patrons and back of house elements for  
40 employees only with a secured entry system. Point  
41 of sales are set up with seven individual cash  
42 registers. Cannibals is not displayed in the front  
43 of store, only displays of accessory products.

44 Storage of cannabis product will be  
45 stored in a secured vault with a highly sensitive  
46 security system, modified two hour fire rated wall.

1                   Regarding security of the building,  
2 there is no cookie cutter approach for these type  
3 of facilities due to the fact that every dispensary  
4 is Unigauged, and every community is unique with  
5 different needs and standards from their police  
6 departments. Not all employees have access to the  
7 vault. There is an assigned code for certain  
8 employees.

9                   The standards of security are in  
10 compliance with the Cannabis Regulatory Commission  
11 such as video surveillance, covering every square  
12 inch of the interior, exterior, parking lot.

13                   OCTOBER 11, 2023

14                   EXCERPT OF TESTIMONY:

15                   NATHAN MOSLEY: My name is Nathan  
16 Mosley. I am a licensed professional engineer in  
17 the State of New Jersey. Senior project manager  
18 and partner with a company called Shropshire  
19 Associates.

20                   The September 29th, 2023 traffic  
21 engineering assessment report specifically is  
22 tailored to the proposed redevelopment of the  
23 existing Auto Mall facility for the proposed  
24 cannabis use you have here before you on this plan.

25                   So the first thing that we do  
whenever we do a traffic study, regardless of the  
type of use, we want to go out and we want to do  
traffic counts at the existing area to get an idea  
of what the existing volumes are in the area. We  
also go out and do a field visit, and see what the  
existing area looks like from the ground level  
itself to see what the traffic patterns are like,  
to see how things operate as far as existing  
driveways, nearby intersections etc, etc.

So you guys probably know this area  
very well. Mola Boulevard intersects with Route 46  
right here at the corner of the property. Route 46  
is a state highway under the jurisdiction of the  
New Jersey Department of Transportation. The  
existing facility has one full movement driveway on  
Mola Boulevard. That driveway allows left turns in  
and out, as well as right turns in and out today.  
It is located opposite a jug-handle ramp, coming  
off of westbound Route 46. That jug-handle ramp  
allows for a left through, and right turn movements  
off of 46. And then we obviously have Mola  
Boulevard with a signalized intersection of Route  
46 and Mola Boulevard.

So when I was out there, one of the  
things that I just wanted to tell you a little bit

1 about that I noticed, and one thing I want to talk  
2 a little bit more as I go through the presentation  
3 was that the existing signalized intersection of 46  
4 and Mola, and I am going to get a little technical,  
5 but it is what we call a three-phase semi-actuated  
6 traffic signal. That means basically that the  
7 signal has a cycle length. It goes through every  
8 single approach. There's three primarily phases of  
9 the signal. The first one obviously is for Route  
10 46 east and west. They get a green ball, that's  
11 your main movement. The DOT always prioritizes the  
12 state highway over every other street and roadway  
13 within the state. That's just how they operate.

14 Then there is two phases for Mola  
15 Boulevard, and it is what we call split phase. So  
16 basically northbound gets green, while the  
17 southbound sits there with the red, and then vice  
18 versa, the southbound gets green, while the  
19 northbound sits there on red.

20 And so one thing that is unique  
21 about this location, and why I want to bring that  
22 up is that, what that does, it creates a lot of  
23 gaps at the future driveway location here for this  
24 site. Because what happen is that, the southbound  
25 traffic all dumps out onto Route 46, or crosses the  
26 roadway, exits this area and clears this whole area  
27 out, and then what you see is the cycle goes  
28 around, and it just slowly starts to fill back up.  
29 It is not a steady stream of traffic going through  
30 this area where you just have cars going by and by  
31 the entire time. But, even during the peak hours,  
32 the busiest times that we counted, it still creates  
33 a lot of gaps in traffic in this location, because  
34 of how that signal operates. So I just want to put  
35 that on there, and I noticed that when I was out  
36 there observing existing conditions in this area  
37 that there were a lot of gaps created just by the  
38 way the traffic signal operates.

39 So again, we did traffic counts out  
40 there. Those counts were done on Tuesday, the 19th  
41 of September, and Saturday the 16th of September.  
42 What I found doing a lot of these cannabis  
43 dispensary uses throughout the state, is that the  
44 typical peak time for these uses that coincides  
45 with the peak of the roadway, this is normally in  
46 the afternoon time between four and six. And on  
47 Saturday between eleven and two. A lot of times the  
48 use itself will get a little bit busier during the  
49 day. On a Saturday, or like on a Friday. But as  
50 far as the peak combined time is when the roadway

1 and the use really happens during that afternoon  
2 commuter time, people are coming home, and on a  
3 Saturday in the middle of the day when people are  
just going out running errands and things like  
that.

4 THE CHAIRMAN: I have a question.  
How did you establish the peak time?

5 THE WITNESS: So we went out and did  
6 traffic counts in the afternoon, from four to seven  
--

7 THE CHAIRMAN: -- yes, I know that.  
8 How did you establish those times?

9 THE WITNESS: We've done parking  
10 studies and analyses of existing facilities to see  
11 what their peak times are, and their peak times  
12 typically are around five to six, or seven o'clock  
13 in the evening on a weekday. And then on Saturday,  
14 normally around three or four in the afternoon.  
15 But, we want to look at kind of the worst case  
16 scenario where you have the most traffic between  
the roadway and the site, and that really occurs  
more when the roadways are at their peak, because  
later in the day on a Friday, or a weekday, or  
evening time, or on a Saturday later in the day, it  
is actually less traffic than the commuter times,  
or in the middle of the day on a Saturday.

17 So really the busiest of the busiest  
18 time happens when the roadway is at its peak,  
19 because that is really your driving volumes for any  
20 use throughout the State, but specifically at this  
21 location here.

22 THE CHAIRMAN: Is there a manual or  
23 something like that, that you use? Standards or a  
24 manual, or is that just your opinion?

25 THE WITNESS: There are practices  
that give you guidance on how to do a traffic  
study, and you follow those guidance, and these  
methods are accepted throughout the State, by the  
DOT, by the County, by the Town, by the Borough  
throughout the State of New Jersey.

THE CHAIRMAN: Okay.

THE WITNESS: So, we have done these  
for many different sites, including sites that DOT  
impact, and DOT has accepted this methodology  
throughout the entire country.

So we counted to see when the peak  
times were. For this area, the peak time in the  
afternoon is from 4:30 to 5:30, and on Saturday  
from 12:00 PM to 1:00 PM.

So once we've establish the existing

1 condition, then the next thing we want to look at  
2 is the traffic that is going to be generated by  
3 this site. So we go to ITE, Institute of  
4 Transpiration Engineers, and ITE has done studies  
5 at various dispensary uses throughout the Country,  
6 they compiled those studies into trip generation  
7 rates that we can utilize and apply to the proposed  
8 development being shown here before you. We take  
9 those rates and we apply it based upon the square  
10 footage of this building. You've heard the  
11 testimony already there will be a 2,900 square foot  
12 building. So based upon the current ITE Trip  
13 Generation rate, it is anticipated that during that  
14 peak hour in the afternoon, and during that peak  
15 hour on a Saturday, the site will generate about  
16 one trip per minute during that peak hour.

17 So a trip is either someone entering  
18 or someone exiting the site. Typically, the trips  
19 are pretty evenly split between inbound and  
20 outbound movements, given the type of facility. A  
21 lot of people they come in, pick up product, and  
22 they exit within that peak hour timeframe.

23 So once they've establish the  
24 traffic that is generated you want to look and  
25 evaluate the operations of the driveway along Mola  
Boulevard, how that's going to work. So, in order  
to evaluate, what we do is called a level of  
service evaluation. This is a standard that's  
accepted throughout the country. Basically, what  
we do is, levels of service are given from a level  
of service A, meaning a driver or motorist  
experiences minimal delays at an intersection,  
whether it is a stop controlled intersection, or a  
traffic signal, down to a level of service F, which  
means you are sitting there for a minute or two  
trying to get out of the driveway, or trying to get  
through a traffic signal, whatever it may be.  
Those are kind of the range of levels in service.

So NJDOT considers anything that's  
level of a service A, B, C or D to be an acceptable  
level of service for a driveway along the State  
highway. So for this condition, being a stop  
controlled driveway, DOT considers anything that's  
a level of service A, B, C or D to be considered an  
acceptable level of service for an access point.

So, under the existing conditions,  
we counted the traffic coming in and out of the  
Auto Mall facility. That driveway on the outbound  
side, the left and right turn movements, operate  
level of service D during both the PM and the

1 Saturday peak hours.

2 When we go to the future, we take  
3 out the Auto Mall traffic, and we put in the new  
4 traffic from the dispensary facility, it will  
5 operate a level of service D during the PM peak  
6 hour, and level of service B during Saturday peak  
7 hours. So again, we have an acceptable level of  
8 service. But, beyond that, I looked at some other  
9 things related to the access to evaluate how it  
10 operates.

11 The one thing I looked at is the on  
12 site queuing. So obviously, anyone exiting out of  
13 this driveway is going to have to wait a little bit  
14 of time before they can make a left, or right hand  
15 turn. We want to make sure that vehicles are not  
16 going to be stacking up within the site, blocking  
17 the on site circulation, blocking the ability  
18 getting in and out of a parking space safely. And  
19 what our analysis showed is that the maximum  
20 queueing anticipated for the outbound side of the  
21 driveway is going to be one vehicle during the PM  
22 and the Saturday peak hour. So when you're at your  
23 busiest, you're going to be probably one vehicle  
24 queued there during the maximum conditions for both  
25 PM and Saturday.

1 Taking it one step further, knowing  
2 that this location was probably going to be  
3 questioned from what I heard from the project team,  
4 there were questions from the board and Borough  
5 already. So I did one additional thing. And what  
6 we did is what is called a gap study. So I don't  
7 know if you heard this before, but again, I am  
8 going to get a little technical, I apologize.

9 But, a gap study basically is you  
10 physically put somebody out there. We are doing  
11 traffic counts anyway, we put another person out  
12 there with a board, and they can electronically  
13 capture the gaps in traffic in both the northbound,  
14 the southbound direction along Mola Boulevard, as  
15 well as the combined gap in traffic that occur.

16 So basically that person sits there  
17 with a board and when there is a gap in traffic in  
18 one direction, they hold the button down. And when  
19 there is a gap in traffic in the other direction,  
20 they hold the button down. When vehicles are going  
21 by the driveway, they let go of the button, because  
22 there are no gaps occurring. So we actually  
23 physically measure the gaps in traffic that occur  
24 throughout the entire time that we were counting  
25 the cars. And then we take that data, and we look

1 at specifically those peak hours to see how many  
2 gaps in traffic occurred, and if there is enough  
3 gaps to accommodate the inbound and outbound  
4 vehicles safely.

5 So what we found for the PM peak  
6 hour, we had enough gaps to accommodate a total of  
7 76 outbound vehicles from this driveway, and  
8 compare that to the anticipation of 28 outbound  
9 trips during the PM peak hour from the driveway for  
10 the use, based upon the ITE Trip generation rate.

11 For a Saturday, we have enough gaps  
12 in traffic to accommodate 152 total vehicles. We  
13 anticipate worst case scenario about 42 total  
14 vehicles exiting the site on a Saturday, during the  
15 peak hour.

16 So again, we have sufficient gaps to  
17 accommodate the outbound movements whether they are  
18 left turns or right turns, out of this driveway,  
19 during both the PM and Saturday peak hour, with a  
20 high, I would say a high threshold, beyond what we  
21 are anticipating. The same thing for the inbound  
22 movement. We looked at the inbound movement and in  
23 that case you only have to cross the southbound  
24 direction. You don't have to cross both directions  
25 in traffic. So there are actually more gaps for  
the inbound movement. There is 185 in the PM peak  
hour. There is enough gaps for 230 inbound vehicles  
on a Saturday. Again, more than sufficient to  
accommodate the number of trips anticipated for  
this site, and this use.

So based upon the level of service  
analysis, based upon my field visit and looking at  
the traffic count data, based upon the gap study  
that was done, it is my opinion that this driveway  
can operate safely and efficiently for this use as  
it exists today. The driveway as it exists today  
can operate safely and efficient for this use based  
upon its size, and the anticipated trip generation.

And that was kind of a conclusion of  
the traffic study that was submitted to the board  
for review.

In addition, I've looked over the on  
site circulation. You've heard the testimony, and  
I do believe the circulation can safely accommodate  
movements throughout the site. I believe it has  
sufficient parking to accommodate the needs for the  
use as well, based upon other sites that I've done,  
as well as based upon the ITE standards.

So, in general, I feel that this  
site is well designed for this proposed use from a

1 traffic perspective.

\*\*\*\*\*

2 The Board's Traffic Engineer will  
3 review the applicant's traffic analysis and will  
4 report back at the November 8th, 2023 Planning  
5 Board meeting for board review.

6 APPLICATION CARRIED TO NOVEMBER 8th,  
7 2023 for continued review.
